PROJECT NAME: Real Time  
Communication System Powered By AI  
For Specially Abled

A screenshot of a web browser window displaying a login form. The browser's address bar shows the URL "E:/Login/file/login.html?". The form contains two input fields: "User name / Email" and "Password". Below these fields is a "Log In Now" button. Underneath the button, the text "log in via" is visible, followed by a large, empty rectangular area, likely intended for social media or alternative login links.

#### About The Project

Artificial Intelligence has made it possible to handle our daily activities in new and simpler ways. With the ability to automate tasks that normally require human intelligence, such as speech and voice recognition, visual perception, predictive text functionality, decision-making, and a variety of other tasks, AI can assist people with disabilities by significantly improving their ability to get around and participate in daily activities.

Currently, Sign Recognition is available **only for alphabets A-I** and not for J-Z, since J-Z alphabets also require Gesture Recognition for them to be able to be predicted correctly to a certain degree of accuracy.
